

Bug B2 – Story 4 (invalid doneStatus filter)

Executive summary

Filtering TODOs with invalid doneStatus value returns 200

Description

When requesting /todos with a non-boolean doneStatus query parameter (for example doneStatus=maybe), the API responds with status 200 OK and returns a list of TODOs instead of rejecting the request with a 400 validation error. Our Story 4 error-flow test ("Filter TODOs with invalid doneStatus value") demonstrates that the invalid filter value is silently accepted.

Potential impact

Clients may pass incorrect filter values and receive data that appears valid, masking parameter-validation bugs on the client side. This can cause confusion when diagnosing issues and breaks the expectation that doneStatus should be a boolean. It also means the API is inconsistent with other endpoints that do perform strict validation.

Steps to reproduce

1. Start the REST API:
`java -jar runTodoManagerRestAPI-1.5.5.jar`
2. Ensure there are at least some TODOs in the system (for example by using POST /todos or the Story 4 Background).
3. Send a GET request with an invalid doneStatus value:
`curl -i "http://localhost:4567/todos?doneStatus=maybe"`
4. Observe that the response status is 200 OK and a list of TODOs is returned, instead of a 400 validation error.
5. This behaviour is exercised in Part B Story 4 – Filter TODOs by completion status (Error Flow / BUG).
