

Bug: Adding TODO to Project via Project Endpoint Creates Unexpected Reverse Relationship

Story

Story 20: Add duplicate todo to project

Pre-Conditions

At least one TODO and one course todo list/project exist on the server.

Steps to Reproduce

- With an existing project id and existing todo id, send POST request to `http://localhost:4567/projects/:id/tasks` with body `{ "id": "" }`
- Send GET request to `http://localhost:4567/todos/:id/tasksof` to check the reverse relationship

Bug Description

Note that since the TODO was added to the project via the project tasks endpoint, the relationship should only be visible from the project side; however, the project also becomes visible from the TODO's tasksof endpoint, meaning the API unexpectedly creates a bidirectional relationship that should not exist when using this endpoint.

Frequency

Occurs all the time.

Productivity Impact

Low

Notes

None.
